

Crixis: An Academic Tracker

I. The Problem

- Throughout the school year, many outputs, activities, and quizzes will be given out, remembering each due date or simply placing it on your calendar can be easily forgotten. Many students receive low grades because they either; aren't prepared, forgot the date, or have no output, all because he/she couldn't keep track of requirements.

II. Project Objectives

- To help students be reminded of their pending projects and upcoming quizzes/activities/exams.
- To encourage students to study or prepare
- Help students become more disciplined on their study habits

III. Implemented Features

- A user log in / sign up so that users can be able to access their personal schedules and requirements saved in their accounts.
- A weekly schedule input that may be updated/edited any time.
- A separated space where students input their upcoming requirements.
- A notification system after every subject and near due dates.
- A user friendly and game-like UI

IV. Planned Inputs and Outputs

- **Input:**
 - The user's personalized account
 - Weekly schedule with time and day
 - Upcoming projects, activities, quizzes, and exams
- **Output:**
 - Notification alerts after each class/period and near due dates

V. Logic Plan

- Our program will first ask for the user to either sign up in order to create a new account to store the user's schedule and requirements or log in to an existing account to easily access the same information last saved. Then the user is basically free to explore the program and input what is needed and will be asked permission to send notifications to consistently update the user on their upcoming tasks.
