

## Week 1: Feature Finalization & Backend Initialization

**Implementation of Core Features:** During this phase, the team finalized the specific list of features to be implemented and established the program's overall flow. Development moved quickly, with more than 50% of the program being completed within the first week.

### Technologies Used:

- **Python Datetime:** Utilized to handle time-tracking and scheduling logic.
- **Tkinter:** Used for the initial drafting of the user interface (UI).

**Design Decisions:** We prioritized the "computing" or backend part of the program, reaching 70-80% completion in this area before fully committing to the UI design.

**Strategy for Success:** We focused on identifying which features required the most attention to ensure the core logic was sound before moving to visual elements.

## Week 2: UI Completion & Feature Integration

**Implementation of Core Features:** We successfully transitioned from rough sketches to a completed UI design. By the end of this week, all decided final features were fully implemented.

### Technologies Used:

- **SQL & Flask:** Integrated into the data collection research to support the program's infrastructure.
- **Tkinter & Datetime:** Continued refinement of the interface and time-sensitive logic.

**Strategy for Success:** We established a plan to have the program tested by several students to ensure it remained user-friendly and functional.

## Week 3: User Testing & System Debugging

**Implementation of Core Features:** Me and my partner's focus shifted to "live" testing. A small group of users tested the program to identify any weak points.

**Technical Challenges:** While the main features remained stable, we realized that the notification system required further "perfecting" to meet project standards.

### Technologies Used:

- **SQL, Flask, and Tkinter:** These were leveraged to maintain the backend-frontend communication while addressing feedback.
- Even though no major new feedback was received from the initial testers, we remained dedicated to updating minor and major issues to ensure a polished product.

## Week 4: Final Optimization & Project Delivery

**Implementation of Core Features:** The notification system was officially perfected, marking the completion of the project's technical requirements.

**User-Centric Refinement:** Based on a final round of feedback from multiple testers, the program was updated to better align with user needs.

**Final Status:** The program was finished on time and is considered fully functional and "good to go".

Me and my teammate were able to take in external feedback and use it to upgrade the program's utility was a key factor in our project's successful conclusion.
